| Theme                  | Water Utilization   |
| Application            | <b>Irrigation Management</b>  |
| Use Case               | Command Area  |
| Use Case ID            | IM-CA-02  |
| Other linked Use cases | Digital Hydro Infrastructure, Forecasted availability, Current Availability, Command area demand, New schemes, Crop production, Irrigation modernization plans, Benchmarking of Irrigation projects, Performance Evaluation Studies, Waterlogging and Salinity, Mobile App for Irrigation Management.   |
| Description            | Irrigation project comprises of the head works (storage or diversion dam), canal and distribution network in the command area for irrigation supplies to the command farmers. The size of the command area is worked out on the basis of water availability and water demand based on the cropping pattern approved by the agronomist, which varies from project to project. Efforts are made to optimise to give higher production and to maximise production per drop of water. The boundary of the command area is fixed based on the topography and other factors.  |
| Used by                | Planners, Decision makers, State WRDs, CWC, Farmers Associations  |
| Priority               | <b>High Priority:</b><br>This use case is the base for proper implementation of irrigation management for enhancing the food production in the country. Command Area component of an irrigation project governs the irrigation potential. Therefore, higher the coverage of command areas, higher will be the irrigation potential and more will be the enhancement in food security scenario.  |
| Phase                  | Phase 2: DSS Development of IWCIMS  |
| Business Problem       | <b>Issue:</b> During planning and formulation of any irrigation project, the command area so available has to be nearer to the project headworks (i.e., source of water) and has also to be suitable for sustained irrigation.<br><b>Approach:</b> It is necessary to carry out soil survey and agrometeorological studies in the command area to establish the soil suitability and land irrigability classifications at the project planning stage itself so that the farmers can cultivate various types of crops accordingly to derive maximum benefits.  |
